APPENDIX J: 2045 PROJECTED VOLUMES (WITH PROPOSED IMPROVEMENTS) SYNCHRO ANALYSIS RESULTS

Executive Summary

Clay County has experienced continuous, sustained growth for the past two-plus decades. The County's population was 141,614 in 2000, 191,434 in 2010, and an estimated 219,252 in 2019. With this growth, an increase of almost 55 percent over 19 years, traffic delays and congestion have also intensified.

This traffic study evaluates the feasibility of extending Radar Road from US 17 to Town Center Boulevard (approximately 1,700' west of US 17). Currently, Radar Road is paved between US 17 and Thunderbolt Park (a distance of approximately 870'). The paved portion is adjacent to the Grace Anglican Church. West of the church property, a dirt road continues west for about 630' and provides access to parking areas (for Thunderbolt Park). A small retention pond is located west of the dirt road and east of the Town Center Boulevard roundabout. The study improvements include access-management and intersection-configuration modifications. Specific focus areas included crash histories, the needs of pedestrians/cyclists, existing vehicle queues, and congestion areas. Existing conditions (2020) and projected conditions (2045) were also used to identify roadway segments and intersections where travel times, delays and congestion are expected to deteriorate.

A proactive plan is suggested and numerous options to improve traffic flow within the study area were considered and/or identified. One short-term improvement is recommended – the County should consider installing flexible, retroreflective backplates on all traffic signal heads.

Long-term improvements are also recommended and include the following:

- Construct Radar Road from Town Center Boulevard to US 17. This connection will likely draw traffic from East-West Parkway and Village Square Parkway in addition to the new apartment complex and Thunderbolt Park. The additional traffic will exceed volumes required for a traffic signal. FDOT will require an Intersection Control Evaluation (ICE) at the US 17 intersection because new signalization is proposed . The purpose of ICE is to consider multiple context-sensitive control strategies when planning a new or modified intersection. From the existing volumes and projected traffic, a restricted crossing U-turn is anticipated to work efficiently and safely at this location and was proposed as a potential improvement. The estimated cost for the Radar Road improvements is **\$6,467,943**.
- Construct a second northbound-to-westbound left-turn bay at the intersection of US 17 and East-West Parkway. This intersection experiences heavy northbound-to-westbound left-turn volumes, especially during the PM peak hour. Currently, there is a single left-turn bay at this location. It appears the existing roadway width will allow the construction of a dual left-turn bay if the US 17 lane widths in this area are reduced to 11'. Additionally based on the volumes, restriping the eastbound approach to include two right-turn lanes and one left-turn lane is recommended. Based on the volumes, this configuration would make the intersection much more efficient. Please refer to the Concept Diagrams in Appendix D. The estimated cost for these improvements is **\$610,158**.
- Construct right-turn bays on the northbound, southbound, and eastbound approaches at the signalized intersection of East-West Parkway and Town Center Boulevard to improve the interseciton's effiency. Please refer to the Concept Diagrams in Appendix D. The estimated cost for these improvements is **\$241,891**.
- Construct a signal at the intersection of Town Center Parkway and Village Square Parkway. Please refer to the Concept Diagrams in Appendix D. The estimated cost for these improvements is **\$329,633**.

I. Introduction

The North Florida TPO asked England-Thims & Miller, Inc. (ETM) to identify potential/reasonable traffic- and safety-related improvements for Radar Road between US 17 and Town Center Boulevard. For this analysis, the project limits include Village Square Parkway (southern limit), Town Center Boulevard (western limit), East-West Parkway (northern limit) and US 17 (eastern limit). The study's purpose is to identify planning opportunities to construct operational/safety improvements, address mobility deficiencies, and implement traffic-flow enhancements.

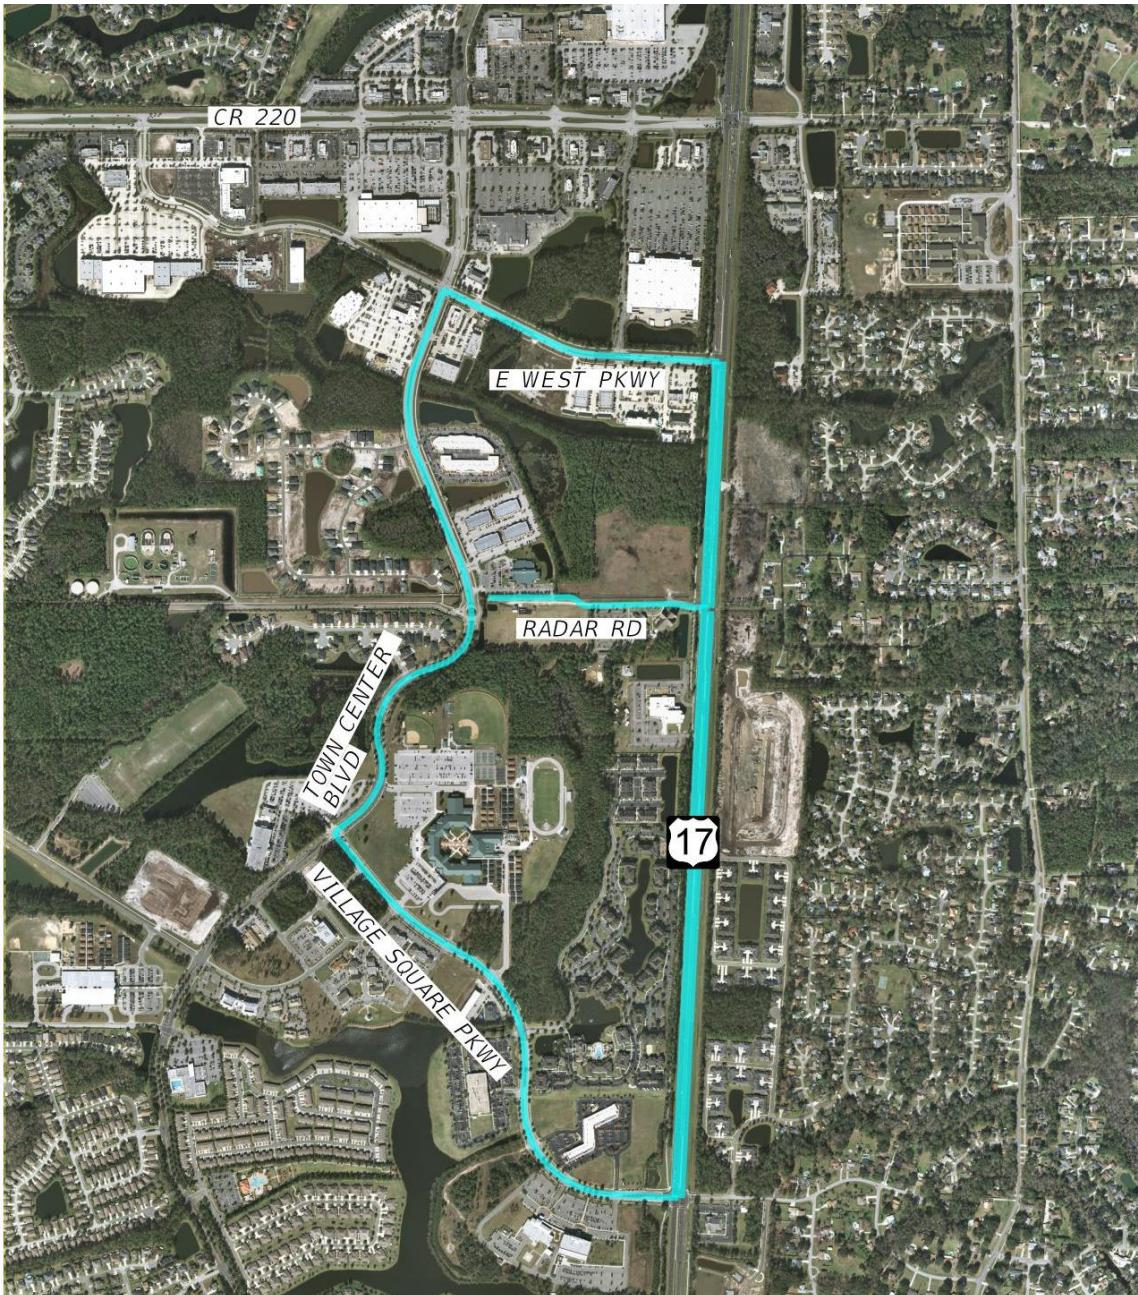

Figure 1 – Project Limits

II. Existing Conditions

Table 1 summarizes the existing conditions for the study corridor. The condition diagrams are provided in Appendix A.

Table 1: Existing Conditions

Feature	Description
Area Location	Clay County
Surrounding Development	The corridor area is predominantly suburban
US 17	<ul style="list-style-type: none"> • <u>Cross Section</u> – six-lane, divided highway • <u>Posted Speed Limit</u> – 55 mph • <u>AADT</u> – 38,300 vpd with a daily T-factor of 6.6% • <u>Sidewalks</u> exist along the west side of the entire section • <u>Street lighting</u> only at the Village Square Parkway, Radar Road, and East-West Parkway intersections
East-West Parkway	<ul style="list-style-type: none"> • <u>Cross Section</u> – four-lane, divided urban • <u>Posted Speed Limit</u> – 35 mph • <u>AADT</u> – 1,900 vpd • <u>Sidewalks</u> exist on both sides of the roadway within the study limits • <u>Street lighting</u> exists within the study limits
Town Center Boulevard	<ul style="list-style-type: none"> • <u>Cross Section</u> – four-lane, divided urban • <u>Posted Speed Limit</u> – 25 mph/35 mph • <u>AADT</u> – 2,200 vpd • <u>Sidewalks</u> exist on both sides of the roadway within the study limits • <u>Street lighting</u> exists within the study limits
Village Square Parkway	<ul style="list-style-type: none"> • <u>Cross Section</u> – four-lane, divided urban • <u>Posted Speed Limit</u> – 25 mph • <u>AADT</u> – 2,300 vpd • <u>Sidewalks</u> exist on both sides of the roadway within the study limits • <u>Street lighting</u> exists within the study limits
Radar Road	<ul style="list-style-type: none"> • <u>Cross Section</u> – two-lane, undivided • <u>Posted Speed Limit</u> – No posted speed limit • <u>Sidewalks</u> do not currently exist • <u>Street lighting</u> exists near US 17 (for the Grace Anglican Church)

III. Traffic Conditions

There are two FDOT Traffic Count Stations within the study limits, one on US 17 and one on Town Center Boulevard. Historical traffic data and traffic characteristics are shown in Table 2 below:

Table 2: Historical Local Traffic Data and Characteristics

Characteristics	FDOT Count Station	
	710189	719127
	US 17 0.6 miles south of CR 220	Town Center Blvd 0.1 miles west of US 17
2005 AADT	35,738	n/a
2006 AADT	37,009	n/a
2007 AADT	37,502	n/a
2008 AADT	36,236	n/a
2009 AADT	36,304	n/a
2010 AADT	36,439	n/a
2011 AADT	35,562	n/a
2012 AADT	35,587	n/a
2013 AADT	35,557	n/a
2014 AADT	36,239	n/a
2015 AADT	37,447	1,950
2016 AADT	38,922	2,000
2017 AADT	40,139	2,000
2018 AADT	40,400	2,050
2019 AADT	41,487	2,300
2020 AADT	38,262	2,200
2019 K-Factor	9	9
2019 D-Factor	54.8	54.5
2019 T-Factor	6.6	1.3

As shown in Figure 2 (next page), the US 17 traffic volumes within the study corridor have remained generally consistent since 2005. Although COVID-19 greatly reduced the 2020 volumes, it is anticipated that the 2021 volumes will rebound to approach the 2019 volumes (more than 40,000 vehicles per day).

(this space intentionally left blank)

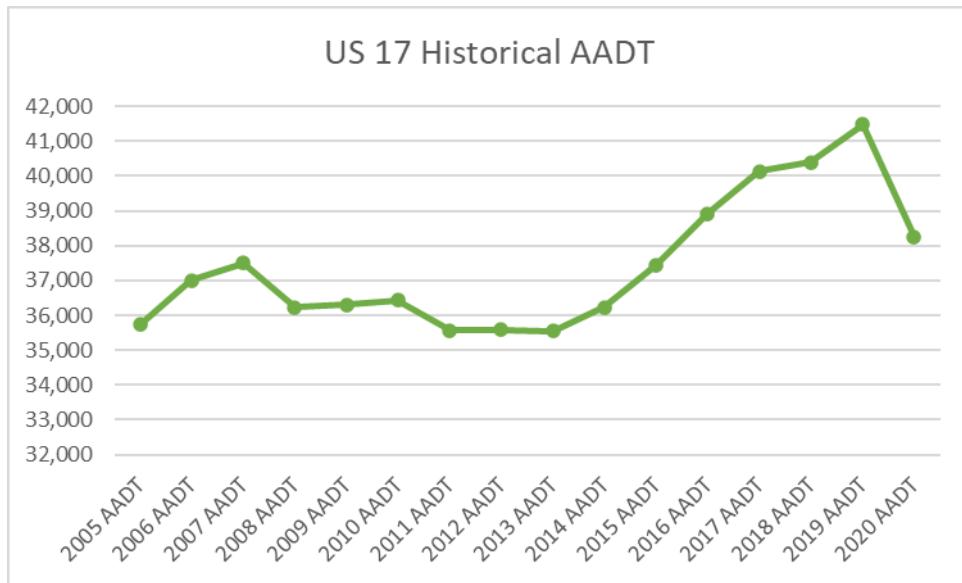

Figure 2 – US 17 – Historic Traffic Volumes

Source: Florida Department of Transportation's Florida Traffic Online

Eight-hour turning-movement counts were collected from 6:30-9:00 AM, 11:30 AM-1:30 PM, and 2:30-6:30 PM, and included pedestrian/bicycle activity at the following intersections:

- US 17 and East-West Parkway (signalized)
- US 17 and Radar Road/Pine Forest Drive
- US 17 and the driveway serving the River Christian Church
- US 17 and Copper Stone Drive
- US 17 and Village Square Parkway/Water Oak Lane
- Town Center Boulevard at the existing roundabout (just west of Thunderbolt Park)
- Town Center Boulevard and East-West Parkway
- Town Center Boulevard and Village Square Parkway

All traffic data collected as part of this study is included in **Appendix F**.

(this space intentionally left blank)

IV. Collision Analysis

Within the study area, crash data was obtained from FDOT's Crash Analysis Reporting System (CARS) and the University of Florida's *Signal Four Analytics* for the period between January 1, 2017 and December 31, 2019. During this time, a total of 266 crashes were reported within the study corridor. An annual summary of the crash types (Table 3), crash severities (Table 4), and lighting/roadway conditions (Table 5) are shown on the following page:

Table 3: Crash Types by Year

Year Type	2017	2018	2019	SUM
Angle	6	9	10	25
Animal	0	2	1	3
Bicycle	4	0	0	4
Head On	3	0	0	3

Unknown	1	0	0	1	
Roadway Condition					266
Dry Pavement	72	67	74	213	
Wet Pavement	10	28	12	50	
Unknown	2	1	0	3	

Additional collision information:

- Three crashes (1.1%) resulted in three fatalities and 73 crashes (27.8%) resulted in 112 injuries
- There were 50 (18.8%) wet-pavement crashes and 63 (23.3%) nighttime crashes, which included dawn and dusk collisions
- The total property damage amount for all 266 crashes was estimated to be \$1,280,460.

Detailed crash summaries for each intersection and collision diagrams are located in **Appendix B** and **Appendix C**, respectively. The three fatal crashes are summarized below:

Wednesday, January 25, 2017 at 6:45 PM: A southbound vehicle on US-17 in the southbound center lane veered across the left lane onto the northbound lanes into the path of oncoming traffic. The southbound vehicle collided with three vehicles heading northbound. The driver of the vehicle heading southbound received fatal injuries from the collision. The drivers' blood-alcohol concentration was not a factor in this crash. The collision occurred on dry pavement under dusk conditions (Crash Report No. 85455282).

Thursday, January 17, 2019 at 12:52 PM: A southbound vehicle on US 17 was stopped in the eastbound left-turn lane at Copper Stone Drive. The driver attempted to complete the left turn directly in front of a northbound vehicle on US 17. The driver of the vehicle heading northbound was unable to avoid the left-turning vehicle and received fatal injuries from the collision. The drivers' blood-alcohol concentration was not a factor in this crash. The collision occurred on dry pavement under daylight conditions (Crash Report No. 87272696).

Sunday, February 17, 2019 at 7:35 PM: A northbound vehicle on Town Center Blvd (approximately 485' north of Village Square Parkway) failed to maintain its lane and collided with a tree in the outside grass shoulder. The driver received fatal injuries from the collision. The driver's blood-alcohol concentration was 0.210%. The collision occurred on dry pavement under dark lighted conditions (Crash Report No. 85220844).

V. Planned Improvements Near Radar Road

There is 180-unit apartment complex planned in the northwest corner of US 17 and Radar Road. Two full access connections to Radar Road are proposed.

VI. Traffic Operational Analysis

A. 2020 Existing Year Results

Operational analyses of existing conditions were conducted using Synchro/SimTraffic analysis software. Intersection turning-movement counts were collected to accurately reflect traffic flows at critical intersections within the study area. The existing roadway network (with 2020 traffic volumes) was analyzed and the LOS results were determined. The analyses at the signalized intersections were based on existing traffic signal timing at the each location.

Synchro software was used to model the roadway network and provide a detailed analysis of the signalized operations. This program considers the effects of signal spacing and signal coordination, including actuated and semi-actuated signal operations, and incorporates traffic volumes, signal timing and vehicle detection. The model output includes intersection approach delays, volume-to-capacity ratios, estimated queue lengths and level-of-service (LOS) results. SimTraffic uses the Synchro model to simulate system-wide traffic operations and produces a visual model of the operating roadway network. This software was used to form a complete and detailed analysis of the system operations. Please refer to Table 6 for the 2020 LOS and Delay results and Appendix H for the supporting traffic-analysis documentation.

Table 6 – Radar Road Signalized Intersections – Synchro Results 2020 AM and PM Peak Hours

Radar Road Extension Feasibility Study Intersections Synchro Results 2020 AM and PM Peak

Intersection Level of Service (LOS) – Existing Conditions

Radar Road at US 17

Although the Synchro results indicate the eastbound movement fails (LOS F) during the PM peak hour, it should be noted this movement only included two (2) left-turning vehicles. It is unlikely that either of these motorists waited 359 seconds (approximately 6 minutes) to complete this eastbound-to-northbound movement.

East West Parkway at US 17

Although the Synchro results indicate the eastbound movement fails (LOS F) during the PM peak hour, it should be noted this movement currently includes two (2) left-turn lanes and a single right-turn lane. Based on the existing turning movement counts collected during the PM peak hour, 122 vehicles turn left while 453 vehicles turn right. Since there are almost four times more traffic turning right than left during this time, it may be beneficial to provide a single left-turn lane and two (2) right-turn lanes.

As shown, all other targeted intersections/approaches operate at acceptable levels during the AM and PM peak hours.

B. 2045 Projected Conditions

To determine future traffic growth on Radar Road and the intersecting streets, Clay County's traffic counts and FDOT's Traffic Online historical volumes were averaged on a yearly basis from 2009 to 2019. Projected (2045) traffic volumes were developed by extrapolating 2020 traffic volumes for a 26-year future growth window assuming an annualized growth rate.

To provide realistic volumes, a minimum increase of 2 percent per year was applied to the Radar Road projections. Historic traffic volumes and growth rates developed for this study are provided in Appendix G.

Operational analyses of future conditions were also conducted using Synchro/SimTraffic analysis software. Of note, the future conditions did not include a Radar Road connection to Town Center Boulevard. Please refer to Table 7 for the 2045 LOS and Delay results (with no Radar Road connection) and Appendix I for the supporting traffic-analysis documentation.

Table 7 – Radar Road Signalized Intersections – Synchro Results 2045 AM and PM Peak Hours

	Town Center Blvd SB	79.7	45.2	E	D				

* Synchro delay exceeds 400 seconds

As shown in Table 7, numerous deficiencies (LOS E and LOS F results) will need to be addressed. The following summaries are provided for each of these intersections:

Village Square Parkway/Water Oak Lane at US 17

If no improvements are implemented, westbound motorists will experience unacceptable congestion during the 2045 AM peak hour. It should be noted the thru and right-turn traffic are currently constrained to one approach lane. Because there are significant volumes for both the thru and right-turn movements, it may be beneficial to provide a dedicated westbound right-turn lane at this intersection.

Radar Road at US 17

Although the Synchro results indicate the eastbound movement will continue to fail (LOS F) during the PM peak hour, it should be noted this movement only included four (4) left-turning vehicles. It is unlikely that these motorists waited more than 400 seconds (approximately 7 minutes) to complete the eastbound-to-northbound movement.

East West Parkway at US 17

Although the Synchro results indicate the eastbound and southbound movements fail (LOS F) during the PM peak hour, it should be noted this is before proposed improvements are in place (which include eastbound dual-right turn bays and northbound dual-left turn bays).

East West Parkway at Town Center Boulevard

Although the Synchro results indicate all approaches will experience unacceptable delays (LOS E) during the PM peak hour, it should be noted this is before proposed improvements are in place (which includes dedicated right-turn bays).

Town Center Boulevard at Village Square Parkway

Although the Synchro results indicate the northbound, southbound and westbound approaches will experience unacceptable delays (LOS E/LOS F) during the PM peak hour, it should be noted this is before proposed improvements are in place (which include replacing the all-way STOP control with a traffic signal).

VII. Potential Operational Improvements

Intersection Level of Service (LOS) – Future Conditions (2045)

After identifying the intersections that were expected to experience unacceptable delays in 2045, additional operational analyses of future conditions (with potential improvements) were also completed using Synchro/SimTraffic analysis software. The primary improvement that was considered as part of this study was the possibility of connecting Radar Road to the roundabout on Town Center Boulevard. Please see Table 10 (next page) for the 2045 LOS and Delay results (with potential improvements in place) and refer to Appendix J for the supporting traffic-analysis results. The following summaries are provided for each intersection:

Village Square Parkway/Water Oak Lane at US 17

Providing a dedicated westbound right-turn lane at this intersection is recommended.

Radar Road at US 17

Because the proposed improvements include the extension of Radar Road to Town Center Boulevard, and because the resulting traffic models indicate significant traffic volumes will use Radar Road to gain access to US 17, providing a signalized directional median opening is recommended.

East West Parkway at US 17

Providing additional intersection capacity (eastbound dual-right turn bays and northbound dual-left turn bays) is recommended.

East West Parkway at Town Center Boulevard

Recommendations include constructing dedicated right-turn bays at this location.

Town Center Boulevard at Village Square Parkway

Replacing the all-way STOP control with a traffic signal is recommended.

As shown in Table 8, the above improvements will provide acceptable LOS results in 2045. Although the Synchro results continue to indicate Radar Road's eastbound movement (at US 17) will fail during the PM peak hour, it should be noted the SimTraffic (simulation) results do not support this outcome.

Table 8 – Radar Road (With Proposed Improvements) – 2045 AM/PM Synchro Results

VIII. Summary of Recommendations

Potential traffic-flow improvements were identified and analyzed. A proactive plan is suggested and numerous options to improve traffic flow within the study area were considered and/or identified. One short-term improvement is recommended – the County should consider installing flexible, retroreflective backplates on all traffic signal heads.

Long-term improvements are also recommended and include the following:

- Construct Radar Road from Town Center Boulevard to US 17. This connection will likely draw traffic from East-West Parkway and Village Square Parkway in addition to the new apartment complex and Thunderbolt Park. The additional traffic will exceed volumes required for a traffic signal. However, FDOT will require an Intersection Control Evaluation (ICE) at the US 17 intersection because new signalization is proposed. The purpose of ICE is to consider multiple context-sensitive control strategies when planning a new or modified intersection. From the existing volumes and projected traffic, a restricted crossing U-turn is anticipated to work efficiently and safely at this location and was proposed as a potential improvement. The estimated cost for the Radar Road improvements is **\$6,467,943**. These costs do not involve right-of-way or coordination efforts. Based on preliminary research, significant coordination efforts will be required.

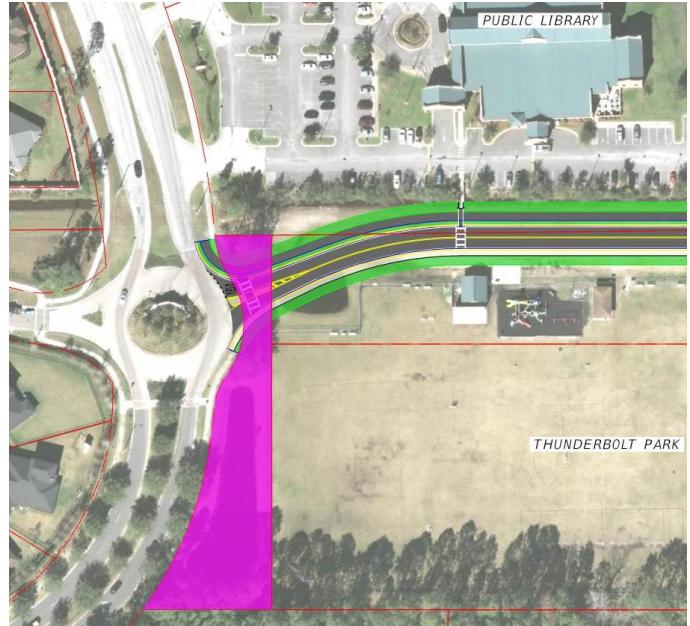

- Construct a second northbound-to-westbound left-turn bay at the intersection of US 17 and East-West Parkway. This intersection experiences heavy northbound-to-westbound left-turn volumes, especially during the PM peak hour. Currently, there is a single left-turn bay at this location. It appears the existing roadway width will allow the construction of a dual left-turn bay if the US 17 lane widths in this area are reduced to 11'. Additionally based on the volumes, restriping the eastbound approach to include two right-turn lanes and one left-turn lane is recommended. Based on the volumes, this configuration would make the intersection much more efficient. Please refer to the Concept Diagrams in Appendix D. The estimated cost for these improvements is **\$610,158**.
- Construct right-turn bays on the northbound, southbound, and eastbound approaches at the signalized intersection of East-West Parkway and Town Center Boulevard to improve the intersection's efficiency. Please refer to the Concept Diagrams in Appendix D. The estimated cost for these improvements is **\$241,891**.
- Construct a signal at the intersection of Town Center Parkway and Village Square Parkway. Please refer to the Concept Diagrams in Appendix D. The estimated cost for these improvements is **\$329,633**.

Details for the cost estimates are included in [Appendix E](#).

IX. Other Considerations

A marked crosswalk was conceptually included at the sidewalk connection between the library and the park. During design, this crosswalk can be enhanced in several ways: two potential improvements include a Rectangular Rapid Flashing Beacon and/or a raised crosswalk.

Significant coordination will be required for the completion of the Radar Road connection at the existing roundabout. Specifically, an easement or right-of-way will be required from the Fleming Island Plantation CDD (identified to the right in pink). Coordination with the FDOT will be required for the connection to US 17, which will likely result in an Intersection Control Evaluation. Several other stakeholders were also identified, including the Public Library, Thunderbolt Park, the Apartment complex, and the Grace Anglican Church.

Currently there are numerous easements surrounding the church and the apartments, including a 30' CEC easement, a 40' drainage and utility easement, and a 100' easement. The shared-use path may need to be moved to the south side of Radar Road to avoid impacting the existing drainage easement.

The proposed Radar Road improvement project will require stormwater treatment and attenuation to meet current SJRWMD criteria. Based on approximately 1.46 acres of additional impervious area, the stormwater management system requirements are estimated to be 0.25 acres. Due to the nature of the project and the adjacent parcel constraints, joint-use ponds appear to be the best alternative. Roadway runoff would be captured by storm drain systems and conveyed into modified ponds at the Grace Anglican Church (east end of the project), and at the Fleming Island Plantation roundabout (west end of the project). Since the Grace Anglican Church pond was sized to capture the runoff from the existing Radar Road pavement section, the pond modifications should be minimal to accommodate half of the proposed project area. The western half of Radar Road could be conveyed to the Fleming Island Plantation roundabout pond. This pond modification would also need to replace the existing park pond (approximately 0.08 acres) impacted by the Radar Road improvements in addition to approximately half of Radar Road's stormwater. SJRWMD will require legal agreements for the joint use of the existing ponds.

Modifications to the Grace Anglican Church pond include steepening the pond bank side slopes and adjusting the existing control structure to provide the required treatment and attenuation. As this pond discharges to the FDOT right-of-way, the existing drainage connection permit will need to be modified. Adjustment to the pond side slopes will also require fencing between the US 17/SR 15 path and the pond bank to provide safety for all users. The Fleming Island Plantation roundabout pond will also require pond side slope steepening and possibly a new control structure. The existing pond currently discharges south into the Town Center Boulevard storm drain system to the Johns Landing subdivision pond and the adjacent wetland area. Fencing would be required to protect users of the park and adjacent sidewalk. An alternative to fencing is enlarging the ponds to meet the attenuation and treatment requirements.

While the Fleming Island Library pond is owned by Clay County, it falls within FEMA flood zone AE. Therefore, the existing pond is part of a studied stream and any modification will require hydraulic model updates and FEMA administrator approval. This pond alternative could lengthen and complicate the permitting process.

Finally, there is an outfall ditch conveying stormwater flows along the north side of Radar Road from the west to US 17/SR 15. The pond outflows from the Clay County Utility Authority WWTP, Eagle Nest Preserve subdivision, and library wetland overflows are conveyed within a 40'-wide ingress, egress, and drainage easement. The proposed improvements to Radar Road should be carefully designed so as to not impact this outfall ditch. Impacts such as filling or piping will require a stormwater design that accounts for a significant offsite area to ensure no adverse impacts to the upstream systems are generated by the new tailwater conditions. Furthermore, the replacement conveyance would have to be sized for the 25-year design storm and could prove to be costly.

Intersection Summary

Cycle Length: 150

Actuated Cycle Length: 150

Offset: 0 (0%), Referenced to phase 6:NBT, Start of Yellow

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 1.15

Intersection Signal Delay: 63.9

Intersection LOS: E

Intersection Capacity Utilization 91.3%

ICU Level of Service F

Analysis Period (min) 15

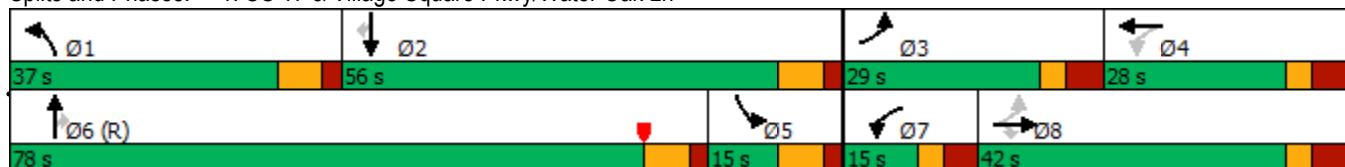

~ Volume exceeds capacity, queue is theoretically infinite.

Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

Splits and Phases: 1: US 17 & Village Square Pkwy/Water Oak Ln

Intersection Summary

Cycle Length: 100

Actuated Cycle Length: 100

Offset: 0 (0%), Referenced to phase 2:SBT, Start of Yellow

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 1.02

Intersection Signal Delay: 32.5

Intersection LOS: C

Intersection Capacity Utilization 89.3%

ICU Level of Service E

Analysis Period (min) 15

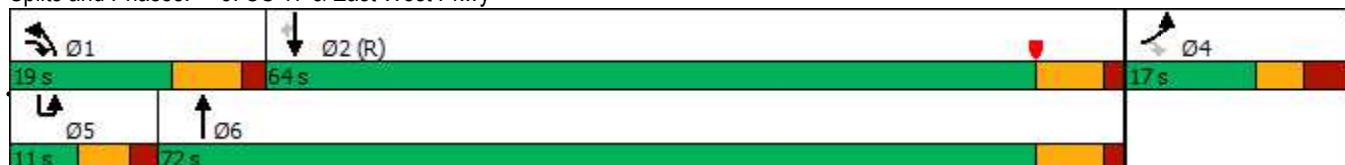

~ Volume exceeds capacity, queue is theoretically infinite.

Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.
